Capitolo 13°

ORACLE
SDO ed 11g

Estensioni di ORACLE

- 13.1 – Concetti spaziali
- 13.2 – Indicizzazione ed interrogazione
- 13.3 – Funzioni particolari
- 13.4 – Oracle Spatial 11g
- 13.5 – Esempio
- 13.6 – Conclusioni

13.1 – Concetti spaziali

- Relazionale-oggetto
- Due dimensioni (x, y)
- Tolleranze
- Layers
- Indicizzazione

Tipi geometrici

- Punti ed insiemi di punti
- Polilinee
- Poligoni
- Catene d'archi
- Poligoni composti
- Cerchi
- Rettangoli ottimizzati

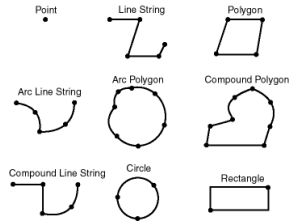

Table 1–1 <layername>_SDOLAYER

SDO_ORDCNT	SDO_LEVEL	SDO_NUMTILES	SDO_COORDSYS

SDO Geom

<layername>_SDOGEOM:

- **SDO_GID** - The SDO_GID column is a unique numeric identifier for each geometry in a layer.
- **SDO_ESEQ** - The SDO_ESEQ column enumerates each element in a geometry, that is, the Element **SEQ**uence number.
- **SDO_ETYPE** - The SDO_ETYPE column is the geometric primitive type of the element. For this release of Spatial Cartridge, the valid values are SDO_GEOM.POINT_TYPE, SDO_GEOM.LINESTRING_TYPE, or SDO_GEOM.POLYGON_TYPE (ETYPE values 1, 2, and 3, respectively). Setting the ETYPE to zero indicates that this element should be ignored.
- **SDO_SEQ** - The SDO_SEQ column records the order (the **SEQ**uence number) of each row of data making up the element.
- **SDO_X1** - X value of the first coordinate.
- **SDO_Y1** - Y value of the first coordinate.
- **SDO_Xn** - X value of the Nth coordinate.
- **SDO_Yn** - Y value of the Nth coordinate.

Creazione oggetti geometrici

```
CREATE TYPE sdo_geometry AS OBJECT (
 SDO_GTYPE NUMBER,
 SDO_SRID NUMBER,
 SDO_POINT SDO_POINT_TYPE,
 SDO_ELEM_INFO MDSYS.SDO_ELEM_INFO_ARRAY,
 SDO_ORDINATES MDSYS.SDO_ORDINATE_ARRAY);
```

SDO_GTYPE

Value	Geometry Type	Description
0	UNKNOWN_GEOMETRY	Spatial ignores this geometry.
1	POINT	Geometry contains one point.
2	LINESTRING	Geometry contains one line string.
3	POLYGON	Geometry contains one polygon with or without holes[1].
4	Collection	Geometry is a heterogeneous collection of elements.[2]
5	MULTIPOINT	Geometry has multiple points.
6	MULTILINESTRING	Geometry has multiple line strings.
7	MULTIPOLYGON	Geometry has multiple, disjoint polygons (more than one exterior boundary).

[1] For a polygon with holes, enter the exterior boundary first, followed by any interior boundaries.
[2] All polygons in the collection must be disjoint.

SDO Index

<layername>_SDOINDEX:

- **SDO_GID** - The SDO_GID column is a unique numeric identifier for each geometry in a layer. This can be thought of as a foreign key back to the <layername>_SDOGEOM table.
- **SDO_CODE** - The SDO_CODE column is the bit-interleaved ID of a tile that covers SDO_GID. The number of bytes needed for the SDO_CODE and SDO_MAXCODE columns depends on the level used for tiling. Use the `SDO_ADMIN.SDO_CODE_SIZE()` function to determine the size required for a given layer. The maximum number of bytes possible is 255.
- **SDO_MAXCODE** - The SDO_MAXCODE column describes a variable-sized logical tile, which is the smallest tile (with the longest tile ID) in the current quadrant. The SDO_MAXCODE column is SDO_CODE padded out one place farther than the longest allowable code name for this index. This column is not used for fixed-size tiles.
- **SDO_GROUPCODE -** The SDO_GROUPCODE column is a prefix of SDO_CODE. It represents a variable-sized tile at level <layername>_SDOLAYER.SDO_LEVEL that contains or is equal to the tile represented by SDO_CODE. This column is not used for fixed-size tiles.
- **SDO_META -** The SDO_META column is not required for spatial queries. It provides information necessary to find the bounds of a tile.

Query

```
SELECT sdo_gid, sdo_x1, sdo_y1
FROM  points_sdogeom a,
      window_sdoindex b
WHERE b.sdo_gid = [area of interest id]
  AND a.sdo_code = b.sdo_code)
  AND sdo_x1 BETWEEN Xmin AND Xmax
  AND sdo_y1 BETWEEN Ymin AND Ymax;
```

Example 1–1

```
SELECT r.sdo_gid
FROM roads_sdoindex r,
     window_sdoindex w
WHERE w.sdo_gid = 5
  AND (r.sdo_code BETWEEN w.sdo_code AND w.sdo_maxcode OR
       w.sdo_code BETWEEN r.sdo_code AND r.sdo_maxcode);
```

Example 1–2

```
SELECT r.sdo_gid
FROM layer_sdoindex r,
     window_sdoindex w
WHERE w.sdo_gid = 5
  AND r.sdo_group_code = w.sdo_groupcode
  AND (r.sdo_code BETWEEN w.sdo_code AND w.sdo_maxcode OR
       w.sdo_code BETWEEN r.sdo_code AND r.sdo_maxcode);
```

INSERIMENTO

Example 2–4

```
INSERT INTO SAMPLE_SDOGEOM (SDO_GID, SDO_ESEQ, SDO_ETYPE, SDO_SEQ,

- Longitudine/latitudine/altitudine/tempo

Creazione di un indice

```
-------------------------------------------------------------------
-- CREATE THE SPATIAL INDEX --
-------------------------------------------------------------------
CREATE INDEX cola_spatial_idx
ON cola_markets(shape)
INDEXTYPE IS MDSYS.SPATIAL_INDEX;
-- Preceding created an R-tree index.
-- Following line was for an earlier quadtree index:
--    PARAMETERS('SDO_LEVEL = 8');
```

Scegliere un tipo d'indice

R-tree Indexing	Quadtree Indexing
The approximation of geometries cannot be fine-tuned. (Spatial uses the minimum bounding rectangles.	The approximation of geometries can be fine-tuned by setting the tiling level and number of tiles.
Index creation and tuning are easier.	Tuning is more complex, and setting the appropriate tuning parameter values can affect performance significantly.
Less storage is required.	More storage is required.
If your application workload includes nearest-neighbor queries (SDO_NN operator), R-tree indexes are faster.	If your application workload includes nearest-neighbor queries (SDO_NN operator), quadtree indexes are slower.
If there is heavy update activity to the spatial column, an R-tree index may not be a good choice.	Heavy update activity does not affect the performance of a quadtree index.
You can index up to four dimensions.	You can index only two dimensions.
An R-tree index is recommended for indexing geodetic data if SDO_WITHIN_DISTANCE queries will be used on it.	
An R-tree index is required for a whole-earth index.

Primo filtraggio

```
SELECT DISTINCT A.SDO_GID,B.SDO_GID
      FROM PARKS_SDOINDEX A, HIGHWAYS_SDOINDEX B
      WHERE A.SDO_CODE = B.SDO_CODE
```

Secondo filtraggio

```
SELECT DISTINCT SDO_GID
  FROM (
          SELECT /*+ index(a  PARKS_SDOINDEX_SDO_CODE_INDEX)
                     index(b HIGHWAYS_SDOINDEX_SDO_CODE_INDEX)
                   use_nl(a b)
                   no_merge */
                DISTINCT A.SDO_GID GID_A, B.SDO_CODE GID_B
           FROM PARKS_SDOINDEX A, HIGHWAYS_SDOINDEX B
          WHERE A.SDO_CODE = B.SDO_CODE
          )
 WHERE SDO_GEOM.RELATE ( 'PARKS',  GID_A,
                         'ANYINTERACT',
                          'HIGHWAYS', GID_B)  <> 'FALSE';
```

Primary Filter

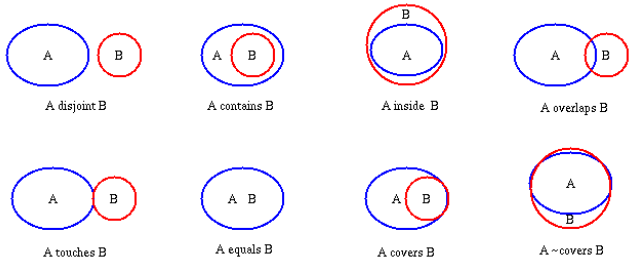
Secondary Filter

13.3 – Funzioni particolari

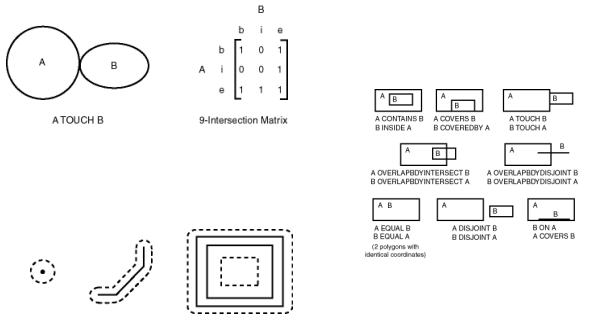
- Operazioni spaziali classiche
- Relazioni topologiche

Function	Description
SDO_GEOM.RELATE	Determines how two objects interact.
SDO_GEOM.SDO_ARC_DENSIFY	Changes each circular arc into an approximation consisting of straight lines, and each circle into a polygon consisting of a series of straight lines that approximate the circle.
SDO_GEOM.SDO_AREA	Computes the area of a two-dimensional polygon.
SDO_GEOM.SDO_BUFFER	Generates a buffer polygon around a geometry.
SDO_GEOM.SDO_CENTROID	Returns the centroid of a polygon.
SDO_GEOM.SDO_CONVEXHULL	Returns a polygon-type object that represents the convex hull of a geometry object.
SDO_GEOM.SDO_DIFFERENCE	Returns a geometry object that is the topological difference (MINUS operation) of two geometry objects.
SDO_GEOM.SDO_DISTANCE	Computes the distance between two geometry objects.
SDO_GEOM.SDO_INTERSECTION	Returns a geometry object that is the topological intersection (AND operation) of two geometry objects.
SDO_GEOM.SDO_LENGTH	Computes the length or perimeter of a geometry.
SDO_GEOM.SDO_MAX_MBR_ORDINATE	Returns the maximum value for the specified ordinate of the minimum bounding rectangle of a geometry object.
SDO_GEOM.SDO_MBR	Returns the minimum bounding rectangle of a geometry.
SDO_GEOM.SDO_MIN_MBR_ORDINATE	Returns the minimum value for the specified ordinate of the minimum bounding rectangle of a geometry object.
SDO_GEOM.SDO_POINTONSURFACE	Returns a point that is guaranteed to be on the surface of a polygon.
SDO_GEOM.SDO_UNION	Returns a geometry object that is the topological union (OR operation) of two geometry objects.
SDO_GEOM.SDO_XOR	Returns a geometry object that is the topological symmetric difference (XOR operation) of two geometry objects.
SDO_GEOM.VALIDATE_GEOMETRY	Determines if a geometry is valid.
SDO_GEOM.VALIDATE_LAYER	Determines if all the geometries stored in a column are valid.
SDO_GEOM.WITHIN_DISTANCE	Determines if two geometries are within a specified Euclidean distance from one another.

Relazioni topologiche di Egenhofer



Esempi di relazioni topologiche



SDO_RELATE

SDO_GEOM.RELATE

Purpose

This function examines two geometry objects to determine their spatial relationship.

Syntax

SDO_GEOM.RELATE (*layername1, SDO_GID1, mask, [layername2,] SDO_GID2*)

SDO_GEOM.RELATE (*layername1, SDO_GID1, mask, X_tolerance, Y_tolerance, SDO_ETYPE, num_ordinates, X_ordinate1, Y_ordinate1 [,...,Xn, Yn] [,SDO_ETYPE, num_ordinates, X_ordinate1, Y_ordinate1 [,...,Xn, Yn]]*)

- ANYINTERACT - Returns TRUE if the objects are not disjoint.
- CONTAINS - Returns TRUE if the second object is entirely within the first object and the object boundaries do not touch.
- COVEREDBY - Returns TRUE if the first object is entirely within the second object and the object boundaries touch at one or more points.
- COVERS - Returns TRUE if the second object is entirely within the first object and the boundaries touch in one or more places.
- DISJOINT - Returns TRUE if the objects have no common boundary or interior points.
- EQUAL - Returns TRUE if the objects share every point of their boundaries and interior, including any holes in the objects.
- INSIDE - Returns TRUE if the first object is entirely within the second object and the object boundaries do not touch.
- OVERLAPBDYDISJOINT - Returns TRUE if the objects overlap, but their boundaries do not interact.
- OVERLAPBDYINTERSECT - Returns TRUE if the object overlap, and their boundaries intersect in one or more places.
- TOUCH - Returns TRUE if the two objects share a common boundary point, but no interior points.

Esempio di query

```
-------------------------------------------------------------------
-- PERFORM SOME SPATIAL QUERIES --
-------------------------------------------------------------------
-- Return the topological intersection of two geometries.
SELECT SDO_GEOM.SDO_INTERSECTION(c_a.shape, c_c.shape, 0.005)
   FROM cola_markets c_a, cola_markets c_c
   WHERE c_a.name = 'cola_a' AND c_c.name = 'cola_c';

-- Do two geometries have any spatial relationship?
SELECT SDO_GEOM.RELATE(c_b.shape, 'anyinteract', c_d.shape, 0.005)
  FROM cola_markets c_b, cola_markets c_d
  WHERE c_b.name = 'cola_b' AND c_d.name = 'cola_d';

-- Return the areas of all cola markets.
SELECT name, SDO_GEOM.SDO_AREA(shape, 0.005) FROM cola_markets;

-- Return the area of just cola_a.
SELECT c.name, SDO_GEOM.SDO_AREA(c.shape, 0.005) FROM cola_markets c
   WHERE c.name = 'cola_a';

-- Return the distance between two geometries.
SELECT SDO_GEOM.SDO_DISTANCE(c_b.shape, c_d.shape, 0.005)
   FROM cola_markets c_b, cola_markets c_d
   WHERE c_b.name = 'cola_b' AND c_d.name = 'cola_d';
```

13.4 – Oracle spatial 11g

- Raster et Georaster
- Topology and Network Data Model
- Map Viewer

Figure 1–1 Raster Space and Model Space

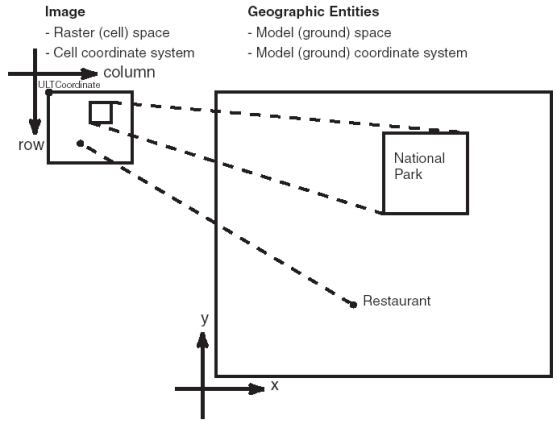


Figure 1–2 Physical Storage of GeoRaster Data

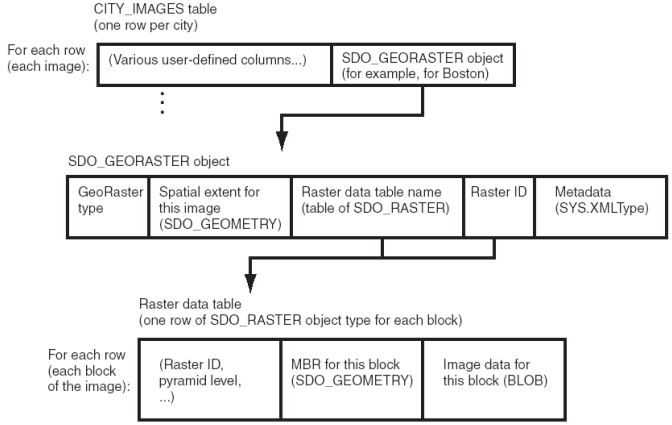

Figure 1–3 GeoRaster Data in an Oracle Database

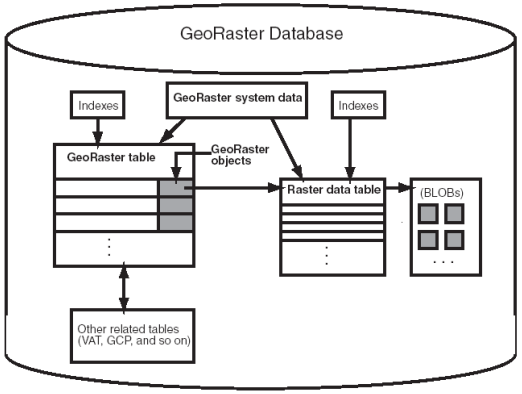

Table 1–3 Subprograms to Validate and Process GeoRaster Objects

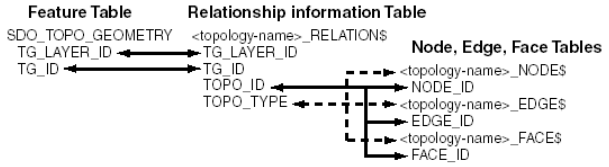
Subprogram	Description
SDO_GEOR.validateGeoraster	Validates a GeoRaster object.
SDO_GEOR.schemaValidate	Validates a GeoRaster object's metadata against the GeoRaster XML schema.
SDO_GEOR.generateSpatialExtent	Generates a Spatial geometry that contains the spatial extent of the GeoRaster object.
SDO_GEOR.generatePyramid	Generates pyramid data for a GeoRaster object, which is stored together with the original data.
SDO_GEOR.deletePyramid	Deletes the pyramid data of a GeoRaster object.
SDO_GEOR.subset	Performs either or both of the following operations: (1) spatial crop, cut, or clip, or (2) layer or band subset.
SDO_GEOR.scale	Scales (enlarges or reduces) a GeoRaster object.
SDO_GEOR.scaleCopy	Scales (enlarges or reduces) a GeoRaster object and puts the result into a new object that reflects the scaling.
SDO_GEOR.changeFormat	Changes the storage format of an existing GeoRaster object (for example, changing the blocking, cell depth, or interleaving).
SDO_GEOR.changeFormatCopy	Makes a copy of an existing GeoRaster object using a different storage format (for example, changing the blocking, cell depth, or interleaving).
SDO_GEOR.georeference	Georeferences a GeoRaster object using specified cell-to-model transformation coefficients.
SDO_GEOR.mosaic	Mosaics GeoRaster objects into one GeoRaster object.

Topology and Network

Figure 1–5 Mapping Between Feature Tables and Topology Tables



Nodes Table

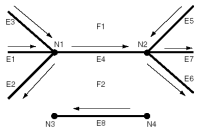
Table 1–3 Columns in the <topology-name>_NODE$ Table

Column Name	Data Type	Description
NODE_ID	NUMBER	Unique ID number for this node.
EDGE_ID	NUMBER	ID number (signed) of the edge (if any) associated with this node.
FACE_ID	NUMBER	ID number of the face (if any) associated with this node.
GEOMETRY	SDO_GEOMETRY	Geometry object (point) representing this node.

Edges table

Table 1–1 Columns in the <topology-name>_EDGE$ Table

Column Name	Data Type	Description
EDGE_ID	NUMBER	Unique ID number for this edge.
START_NODE_ID	NUMBER	ID number of the start node for this edge.
END_NODE_ID	NUMBER	ID number of the end node for this edge.
NEXT_LEFT_EDGE_ID	NUMBER	ID number (signed) of the next left edge for this edge.
PREV_LEFT_EDGE_ID	NUMBER	ID number (signed) of the previous left edge for this edge.
NEXT_RIGHT_EDGE_ID	NUMBER	ID number (signed) of the next right edge for this edge.
PREV_RIGHT_EDGE_ID	NUMBER	ID number (signed) of the previous right edge for this edge.
LEFT_FACE_ID	NUMBER	ID number of the left face for this edge.
RIGHT_FACE_ID	NUMBER	ID number of the right face for this edge.
GEOMETRY	SDO_GEOMETRY	Geometry object (line string) representing this edge.



Faces Table

Table 1–4 Columns in the <topology-name>_FACE$ Table

Column Name	Data Type	Description
FACE_ID	NUMBER	Unique ID number for this face.
BOUNDARY_EDGE_ID	NUMBER	ID number of the boundary edge for this face. The sign of this number (which is ignored for use as a key) indicates which orientation is being used for this boundary component (positive numbers indicate the left of the edge, and negative numbers indicate the right of the edge).
ISLAND_EDGE_ID_LIST	SDO_LIST_TYPE	Island edges (if any) in this face.
ISLAND_NODE_ID_LIST	SDO_LIST_TYPE	Island nodes (if any) in this face.
MBR_GEOMETRY	SDO_GEOMETRY	Minimum bounding rectangle (MBR) that encloses this face. (This is not required. However, if the MBR is specified and if a spatial R-tree index is defined on this geometry, the face can be retrieved more efficiently.)

Creating the topology

```
-- Create the topology. (Null SRID in this example.)
EXECUTE SDO_TOPO.CREATE_TOPOLOGY('LAND_USE_HIER', 0.00005);
-- Create feature tables.
CREATE TABLE land_parcels ( -- Land parcels (selected faces)
   feature_name VARCHAR2(30) PRIMARY KEY,
   feature SDO_TOPO_GEOMETRY);
CREATE TABLE block_groups (
   feature_name VARCHAR2(30) PRIMARY KEY,
   feature SDO_TOPO_GEOMETRY);
CREATE TABLE tracts (
   feature_name VARCHAR2(30) PRIMARY KEY,
   feature SDO_TOPO_GEOMETRY);
CREATE TABLE counties (
   feature_name VARCHAR2(30) PRIMARY KEY,
   feature SDO_TOPO_GEOMETRY);
CREATE TABLE states (
   feature_name VARCHAR2(30) PRIMARY KEY,
   feature SDO_TOPO_GEOMETRY);
```

Esempio PL/SQL

```
DECLARE
   land_parcels_id NUMBER;
   block_groups_id NUMBER;
   tracts_id NUMBER;
   counties_id NUMBER;
BEGIN
   SDO_TOPO.ADD_TOPO_GEOMETRY_LAYER('LAND_USE_HIER', 'LAND_PARCELS',
        'FEATURE','POLYGON');
   SELECT tg_layer_id INTO land_parcels_id FROM user_sdo_topo_info
   WHERE topology = 'LAND_USE_HIER' AND table_name = 'LAND_PARCELS';
   SDO_TOPO.ADD_TOPO_GEOMETRY_LAYER('LAND_USE_HIER', 'BLOCK_GROUPS',
        'FEATURE','POLYGON', NULL, land_parcels_id);
   SELECT tg_layer_id INTO block_groups_id FROM user_sdo_topo_info
        Topology Data Model Tables
        WHERE topology = 'LAND_USE_HIER' AND table_name = 'BLOCK_GROUPS';
   SDO_TOPO.ADD_TOPO_GEOMETRY_LAYER('LAND_USE_HIER', 'TRACTS',
        'FEATURE','POLYGON', NULL, block_groups_id);
   SELECT tg_layer_id INTO tracts_id FROM user_sdo_topo_info
        WHERE topology = 'LAND_USE_HIER' AND table_name = 'TRACTS';
   SDO_TOPO.ADD_TOPO_GEOMETRY_LAYER('LAND_USE_HIER', 'COUNTIES',
        'FEATURE','POLYGON', NULL, tracts_id);
   SELECT tg_layer_id INTO counties_id FROM user_sdo_topo_info
        WHERE topology = 'LAND_USE_HIER' AND table_name = 'COUNTIES';
   SDO_TOPO.ADD_TOPO_GEOMETRY_LAYER('LAND_USE_HIER', 'STATES',
        'FEATURE','POLYGON', NULL, counties_id);
END;
```

SDO_TOPO_GEOMETRY Type

```
CREATE TYPE sdo_topo_geometry AS OBJECT
  (tg_type NUMBER,
   tg_id NUMBER,
   tg_layer_id NUMBER,
   topology_id NUMBER
  );
```

Table 1–7 SDO_TOPO_GEOMETRY Type Attributes

Attribute	Explanation
TG_TYPE	Type of topology geometry: 1 = point, 2 = line string, 3 = polygon or multipolygon, 4 = heterogeneous collection. Note: Most real world topology geometries are one of the *multi* types.
TG_ID	Unique ID number (generated by Spatial) for the topology geometry.
TG_LAYER_ID	ID number for the topology geometry layer to which the topology geometry belongs. (This number is generated by Spatial, and it is unique within the topology geometry layer.)
TOPOLOGY_ID	Unique ID number (generated by Spatial) for the topology.

Example 1–3 INSERT Using Constructor with SDO_TOPO_OBJECT_ARRAY

```
INSERT INTO land_parcels VALUES ('P1', -- Feature name
  SDO_TOPO_GEOMETRY(
    'CITY_DATA', -- Topology name
    3, -- Topology geometry type (polygon/multipolygon)
    1, -- TG_LAYER_ID for this topology (from ALL_SDO_TOPO_METADATA)
    SDO_TOPO_OBJECT_ARRAY (
      SDO_TOPO_OBJECT (3, 3), -- face_id = 3
      SDO_TOPO_OBJECT (6, 3))) -- face_id = 6
);

INSERT INTO land_parcels VALUES ('P1A', -- Feature name
  SDO_TOPO_GEOMETRY(
    'CITY_DATA', -- Topology name
    'LAND_PARCELS', -- Table name
    'FEATURE', -- Column name
    3, -- Topology geometry type (polygon/multipolygon)
    SDO_TOPO_OBJECT_ARRAY (
      SDO_TOPO_OBJECT (3, 3), -- face_id = 3
      SDO_TOPO_OBJECT (6, 3))) -- face_id = 6
);
```

                 </Point>
              </geometricProperty>
           </geoFeature>
        </center>
    </map_request>';
```

Esempio d'interazioni tra PL/SQL e Map Viewer

```
    l_http_req := utl_http.begin_request(l_url, 'POST', 'HTTP/1.0');
    --
    -- sets up proper HTTP headers
    --
    utl_http.set_header(l_http_req, 'Content-Type',
         'application/x-www-form-urlencoded');
    utl_http.set_header(l_http_req, 'Content-Length',
    length('xml_request=' ||   map_req));
    utl_http.set_header(l_http_req, 'Host', 'my_corp.com');
    utl_http.set_header(l_http_req, 'Port', '8888');
    utl_http.write_text(l_http_req, 'xml_request=' || map_req);
    --
    l_http_resp := utl_http.get_response(l_http_req);
    utl_http.read_text(l_http_resp, l_value);
    response := sys.xmltype.createxml (l_value);
    utl_http.end_response(l_http_resp);
    img_url := response.extract('/map_response/map_image/map_
         content/@url').getstringval();
    dbms_output.put_line(img_url);
end;
```

13.5 – Esempio

- You wish to open an upscale beauty salon in central Contra Costa county, California, catering to wealthier, older women.
- You would like to be close to a major thoroughfare for ease of access.
- You don’t want to be too close to any competitors.

Identify Types and Sources of Data Needed to Support Decision

- Competitors: Internet Search Engine
- Demographic (Age, Gender, Income): U.S. Census Bureau
- Roads: U.S. Geological Survey

Oracle Spatial by Example
Competitor Data: Table

```
CREATE TABLE beauty (id              NUMBER(38),
                     name            VARCHAR2(100),
                     full_address    VARCHAR2(100),
                     city_state      VARCHAR2(50),
                     street_number   VARCHAR2(10),
                     street_name     VARCHAR2(20),
                     street_type     VARCHAR2(15),
                     street_prefix   VARCHAR2(10),
                     street_suffix   VARCHAR2(10),
                     city            VARCHAR2(40),
                     state           VARCHAR2(2),
                     postal_code     VARCHAR2(16),
                     location        MDSYS.SDO_GEOMETRY);
```

Oracle Spatial by Example
Competitor Data: Spatial Metadata

```
INSERT INTO user_sdo_geom_metadata VALUES
  ('BEAUTY',                          -- Geometry Table
   'LOCATION',                        -- Geometry Column
    SDO_DIM_ARRY (
     SDO_DIM_ELEMENT ('LONGITUDE',    -- Longitude Text
                      -180,             --   Lower Boundary
                      180,              --   Upper Boundary
                      0.5),             --   Tolerance
     SDO_DIM_ELEMENT ('LATITUDE',     -- Latitude Text
                        -90,            --   Lower Boundary
                        90,             --   Upper Boundary
                        0.5)            --   Tolerance
     ),
     8307                               -- (SRID) Datum:WGS84
  );
```

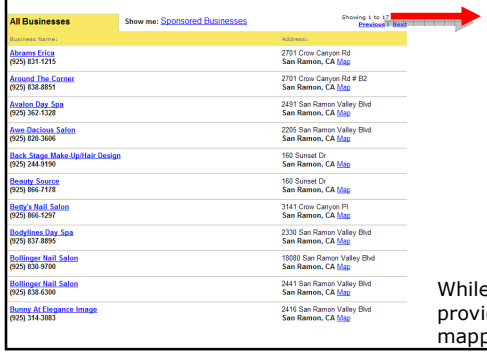
Oracle Spatial by Example
Competitor Data: Spatial Index

```
CREATE INDEX beauty_spatial_idx ON beauty (location)
INDEXTYPE IS MDSYS.SPATIAL_INDEX;
```

- R-Tree Index
- These are unlike regular Oracle indexes and special steps must be taken with their administration.

Oracle Spatial by Example
Competitor Data: Source

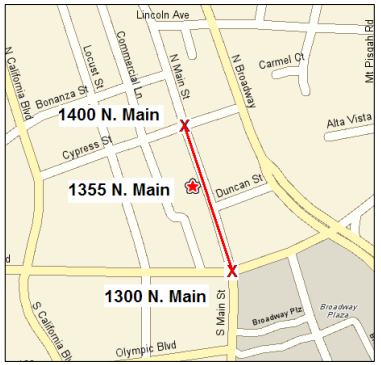
Extract list of competitors and their addresses from Search Engine.



```
Name
----------------
ID
NAME
FULL_ADDRESS
CITY_STATE
STREET_NUMBER
STREET_NAME
STREET_TYPE
STREET_PREFIX
STREET_SUFFIX
CITY
STATE
POSTAL_CODE
LOCATION
```

While very useful, it doesn't provide any directly mappable data.

Oracle Spatial by Example
Competitor Data: Geocoding



- The Geocoder will
  - Standardize Address Name and,
  - Using a database with the coordinates and street addresses of each intersection,
  - Interpolate the location of the given address.
- Oracle Spatial Option geocoder: added-cost
- Third party sells spatial database used to calculate the coordinates

Oracle Spatial by Example
Competitor Data: Geocoding

Solution: Use Perl Program against internet geocoding website.

```
#!/usr/local/bin/perl
# simplest_xmlrpc.pl
use XMLRPC::Lite;
use Data::Dumper;
use strict;
use warnings;
my $where = shift @ARGV
  or die "Usage: $0 \"1 Main St, Anytown, KS\"\n";
my $result = XMLRPC::Lite
  -> proxy( 'http://rpc.geocoder.us/service/xmlrpc' )
  -> geocode ($where)
  -> result;
print Dumper $result;
```

```

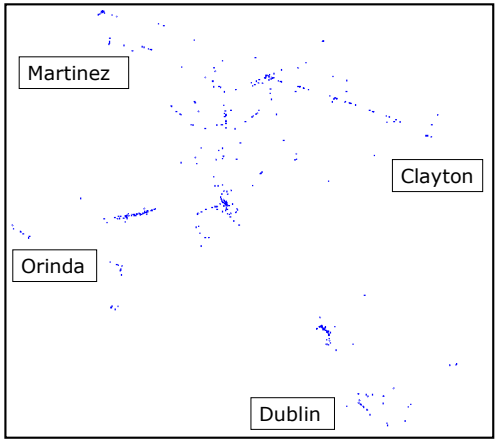
Oracle Spatial by Example
Competitor Data: SDO_GEOMETRY Object-Relational Type

```
UPDATE beauty
   SET location      =
         SDO_GEOMETRY
          (2001,      -- Geometry Type: 2-D Point
           8307,            -- SRID, Datum: WGS84
           SDO_POINT_TYPE
             (-122.060445,  -- Longitude
              37.898365,    -- Latitude
              NULL),
            NULL,
            NULL
            )
 WHERE id = 430;
```

Oracle Spatial by Example
Competitor Data: Data Display

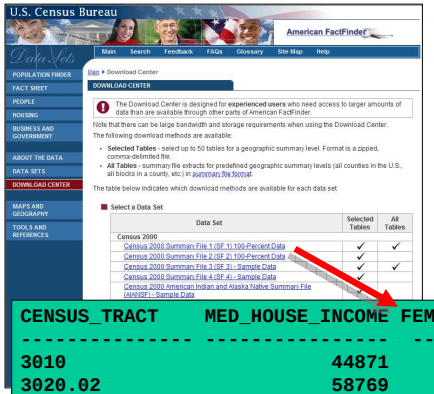


- eSpatial iSmart Explorer free on OTN
- OEM Spatial Index Advisor
- Oracle Mapviewer
- For serious users, many commercial products.

Oracle Spatial by Example
Non-Spatial Demographic Data: Table

```
CREATE TABLE census_data (
  CENSUS_TRACT       VARCHAR2(10)NOT NULL,
  MED_HOUSE_INCOME   NUMBER(38),
  GENDER_TOTAL       NUMBER(38),
  FEMALE_GE_40       NUMBER(38));
```

Oracle Spatial by Example
Non-Spatial Demographic Data: Source

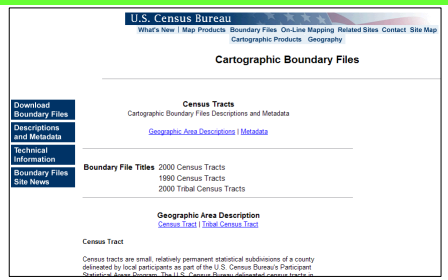


- U.S. Census Bureau
- factfinder.census.gov
- "Download Center"
- Select detailed or summarized data by state, county, and census tract.

CENSUS_TRACT	MED_HOUSE_INCOME	FEMALE_GE_40	GENDER_TOTAL
3010	44871	975	3355
3020.02	58769	1467	8475

* * * * * * *

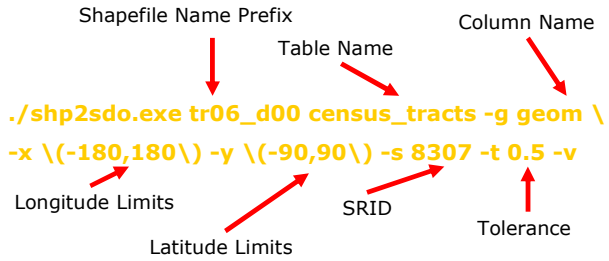
Oracle Spatial by Example
Spatial Census Tract Data: Source



- www.census.gov/geo/www/cob/tr_metadata.html
- Has geographic boundaries of Census Tracts which can be loaded into Oracle Spatial.
- Choose state and "ARCVIEW Shapefile" format to download file for California. These files are sometimes called "ESRI Shapefiles".

Oracle Spatial by Example
Spatial Census Tract Data: Pre-processing

- shp2sdo utility downloadable from Oracle will create SQL and SQL*Loader data and control files for creating Spatial objects and loading shapefile data into Oracle Spatial.



Creates: census_tracts.sql, census_tracts.ctl, census_tracts.dat

Oracle Spatial by Example
Spatial Census Tract Data: Loading
census_tract.sql

```
DROP TABLE CENSUS_TRACTS;

CREATE TABLE CENSUS_TRACTS (
  AREA          NUMBER,
  PERIMETER     NUMBER,
  TR06_D00_     NUMBER,
  TR06_D00_I    NUMBER,
  STATE         VARCHAR2(2),
  COUNTY        VARCHAR2(3),
  TRACT         VARCHAR2(6),
  NAME          VARCHAR2(90),
  LSAD          VARCHAR2(2),
  LSAD_TRANS    VARCHAR2(50),
  GEOM          MDSYS.SDO_GEOMETRY);
```

Oracle Spatial by Example
Spatial Census Tract Data: Loading

- In SQL*Plus:

connect spatial/spatial

@census_tracts.sql

- Run SQL*Loader:

sqlldr spatial/spatial census_tracts

- In SQL*Plus:

connect spatial/spatial

EXECUTE
SDO_MIGRATE.TO_CURRENT('CENSUS_TRACTS','GEOM)'
